The essentials of imaging

P R O F E S S I O N A L 1 6 0
for Color Print

Portraits are important milestones along the path of life.
The photographer can't help but sense how much this photo means to the subject.
True to its name, PROFESSIONAL160 offers superb expressiveness and reliable quality.
The film for professional portraits.

Superb stability and expressiveness for demanding professionals

Konica Minolta Professional 160 is a high-quality color negative film designed for professional portrait, wedding, commercial, and industrial photography. Featuring the latest advances in Konica Minolta technology, this film provides rich gradations, superb granularity and natural reproduction of facial tones. Richly expressive and with outstanding stability, this film is designed to meet the stringent requirements of demanding professionals.

Smooth, continuous skin tones

A rich range of gradations from highlights to shadows delivers excellent gradation balance for smooth colors and natural facial tones. Subtle nuances in both highlights and shadows add to the presentation of beautiful portrait photos.

Faithful color reproduction

Faithful reproduction of every color in the subject, including bright colors like magenta, and difficult to capture intermediate tones such as teal(blue/green). Subtle nuances in tone are captured and reproduced with rich, natural expressiveness. Reproduction of black and white tones is also superb, resulting in excellent rendition of wedding dresses and formal wear. Now it is easier than ever for the photographer to control skin tones and other colors to achieve the desired effect.

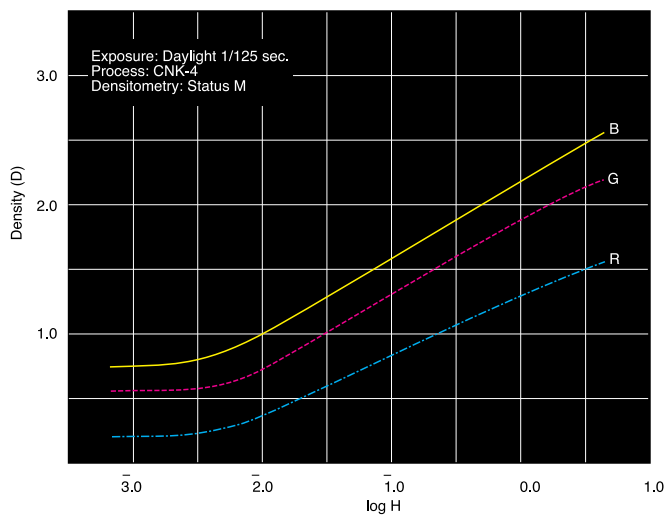

Vivid images even when enlarged

Konica Minolta's advanced halogen silver crystal technology delivers fine granularity at a higher level than ever before. Images are more detailed, with finer texture, for vivid reproduction of skin tones and clothing. The ultra-fine granularity delivers vivid images that remain detailed and accurate, regardless of enlargement size.

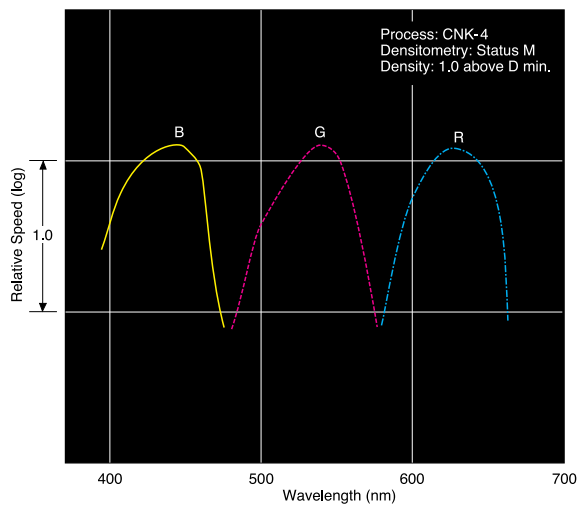

Outstanding Stability

Enhanced keeping characteristics prior to exposure and improved latent image stability after exposure ensure that your images will be developed just as you shot them. Greater resistance to pressure marks and scratches protects your images from camera to final printing. Excellent design compatibility with photofinishing equipment provides for easier handling in the photo lab.
